Chapter 6 Dynamic programming In the preceding chapters we have seen some elegant design principles such as divide-and-conquer, graph exploration, and greedy choices that yield denitive algorithms for a variety of important computational tasks. The drawback of these tools is that they can only be used on very specic types of problems.

6.21 (DPV) Let C(v) be the size of a minimum vertex cover of the subtree rooted at v. Answer: C(root) Base Case: C(leaf) = 0. Case 1 (v is in the solution) Then the optimal way to extend the partial solution is to take the optimal solution of each child. i.e. $1 + \sum_{i \in \text{children}(v)} C(i)$
