source strongly connected component. This can be determined in linear time: run the SCC algorithm, construct the metagraph, use the source-finding algorithm from an earlier homework to return all sources, and check if there is only one source. The only step that needs further clarification is the construction of the metagraph. The SCC algorithm

conv(S). Then any algorithm which actually computes the convex hull of S would output the points in the set S in a sorted order. Hence we have at least $(n \log n)$ complexity of any algorithm for finding the convex hull of S. XII. Exercise 4.21 from ALGORITHMS- VAZIRANI [3] (a) Construct a graph $G(V;E)$ as follows. The algorithm runs in linear time since it takes $O(m)$ time (where m is the number of edges) to go over each vertex to calculate the degree of the vertex, and $O(m)$ time to go over them again and sum the degrees of vertices to compute `twodegree[]`. Therefore, the total time complexity is also $O(m)$. 3.13 (DPV) (a) Consider a DFS tree T constructed ...
