Fetal Heart Monitoring - AWHONN

Fetal heart rate monitoring may be performed externally or internally. Most external monitors use a Doppler device with computerized logic to interpret and count the Doppler signals. Internal FHR monitoring is accomplished with a fetal electrode, which is a spiral wire placed directly on the fetal scalp or other presenting part.

ACOG PRACTICE BULLETIN

Early in gestation the fetal heart rate is predominately under the control of the sympathetic nervous system and arterial chemoreceptors. As the fetus develops its heart rate decreases in response to parasympathetic (vagal stimulation) nervous system maturation and variability becomes more pronounced.
