The four fundamental laws of thermodynamics express empirical facts and define physical quantities, such as temperature, heat, thermodynamic work, and entropy, that characterize thermodynamic processes and thermodynamic systems in thermodynamic equilibrium. They describe the relationships between these quantities, and form a basis for precluding the possibility of certain phenomena, such as perpetual motion. In addition to their use in thermodynamics, the laws have interdisciplinary applications

The law states "If two thermodynamic systems are each in thermal equilibrium with a third, then they are in thermal equilibrium with each other." Basically, if A=B and C=B then A=C. This may seem so obvious that it doesn't need stating but without this law we couldn't define temperature and we couldn't build thermometers. The First Law

That is where the law of dynamics comes in. The law of dynamics tells us what the acceleration is. It says the acceleration is  $-x \cdot v_x(t + \epsilon) = v_x(t) + \epsilon a_x(t) = v_x(t) - \epsilon x(t)$ . Equation (9.14) is merely kinematics; it says that a velocity changes because of the presence of acceleration.
